BEST PRACTICE IN AMPUTEE REHABILITATION

Greg Bowring
Amputee Service
Prince of Wales Hospital
KEY ELEMENTS ADDRESSED BY THE GUIDELINE

1. Defines the phases of rehabilitation care and the steps included in each phase.
2. Recognizes the importance of comprehensive interdisciplinary assessment of the patient before and after surgery and understanding the physical and social support system.
3. Recognizes the importance of the decision about the appropriate level of amputation to maximize function.
4. Discusses surgical principles to optimize wound healing and shaping of the residual limb for prosthetic rehabilitation.
5. Discusses immediate postoperative dressing and management of the residual limb to maximize healing and functional outcome.
6. Identifies key elements of the rehabilitation treatment and prosthetic training across all phases of the rehabilitation process.
7. Emphasizes the importance of foot care to prevent future amputation and optimize the condition of the contralateral limb.
8. Describes the key components of medical management of medical comorbidities and prevention of complications.
9. Addresses strategies for pain management across all phases of the rehabilitation process.
10. Emphasizes the contribution of behavioral health assessment and intervention.
11. Recognizes the importance of patient education.
12. Emphasizes the need for life-long follow-up care.

VA access to full guideline: http://www.opp.medi.va.gov/opp/cpg/cpg.htm
DoD access to full guideline: http://www.opp.medi.va.gov/opp/cpg/cpg.htm
Sponsored & produced by the VA Employee Education System in cooperation with the Offices of Quality & Performance and Patient Care Services and the Department of Defense.

January 2008
The clinical practice guideline is designed to achieve several specific goals:

1. Describe prosthetic training, physical conditioning, and psychosocial rehabilitation to maximize the patient’s function and quality of life.

2. Describe appropriate interventions to optimize the patient’s physical function after an amputation (e.g., strength, aerobic endurance, and balance).

3. Promote an interdisciplinary team approach that is patient focused.

4. Revise existing clinical pathways to be consistent with current evidence-based rehabilitation methods.

5. Provide facilities with a structured framework of appropriate rehabilitation interventions to improve the patient’s outcome and reduce current practice variation.

6. Establish priorities for future research efforts that will generate practice-based evidence.

7. Identify outcome measures that can ultimately be used to improve practice in the field and in future guidelines.

8. Assist in identifying priorities for research efforts and allocation of resources.

VA/DoD CPG for Rehab of LL Amputation 2007
1. **Postoperative Pain**
   - Reduce residual limb pain, improve effectiveness of coping, and reduce interference with daily function
   - Reduce phantom limb pain
   - Decrease consumption of narcotics (amount and type of pain medications throughout the acute surgical and early pre-prosthetic training phases)
2. Physical Health

- Reduce the risk of adverse effects due to periods of prolonged immobilization:
  - Decrease contractures
  - Decrease incidence of pressure ulcers
  - Decrease incidence of deep vein thrombosis

- Improve physical status (e.g., balance, normal range of motion especially at the hips and knees; increase strength and endurance to maximize efficient use of a prosthesis)
3. Function

- Improve functional status (e.g., independent bed mobility, independent transfer, wheelchair mobility, gait, and safety)
- Improve ambulation (e.g., distance of ambulation, hours of prosthetic wearing, use of an assistive device, and ability to ascend/descend stairs)
- Improve quality of life/decrease activity limitation (e.g., activities of daily living [ADL], recreation, physical activity beyond ADL, community re-integration; and return to home environment)
4. Psychological Support and Well-Being
   - Reduce psychological comorbidities pre- and postoperative (e.g., depressive and anxiety disorders)
   - Improve the quality of life
   - Decrease the physical and mental/emotional disease burden
5. Patient Satisfaction

- Improve satisfaction with the level of skills and levels of independence individual patients have been able to achieve
- For patients receiving prostheses, improve satisfaction with the prosthesis (comfort, functionality, and cosmesis)
- Improve satisfaction with the progress of care and status at discharge

(VA/DoD CPG for Rehab of LL Amputation 2007)
6. **Reintegration** (*decrease participation restrictions*)

- Improve the discharge outcome (discharge to the least restrictive environment)
- Improve vocational outcomes
- Improve recreational participation
- Maximize community participation
7. Healthcare Utilization (length of stay)

- Optimize the length of rehabilitation stay
- Optimize the time from prosthetic fitting to reaching the mobility goals, regardless of the process of rehabilitation
- Increase life-long follow-up
Phases of Amputee Rehab
(Eskenazi ’01)

1. Pre-operative
2. Amputation surgery/dressing
3. Acute post surgical
4. Pre-prosthetic
5. Prosthetic prescription/fabrication
6. Prosthetic training
7. Community integration
8. Vocational rehabilitation
9. Follow-up
Core and Module approach
(VA/DoD CPG for Rehab of LL Amputation 2007)

- **Core** recommendations cut across the phases
- **Module** recommendations correspond to phases of Amputee Rehabilitation
  A. Pre-operative
  B. Immediate Post-op
  C. Pre-prosthetic Rehab
  D. Prosthetic Training
  E. Rehab & Prosthesis Follow-up
Core recommendations
CORE-1.

- **Interdisciplinary Consultation/Assessment**

  *Interdisciplinary team assessment and management should be employed in the care of all patients with amputations throughout all phases of care*
Core recommendations
CORE-2.

- Rehabilitation Treatment Plan
- A comprehensive, interdisciplinary, patient-centered treatment plan should be developed early in the course of the rehabilitation process, and updated and modified throughout all phases of care.
Core recommendations CORE-3.

- **Pain Management**

  *Pain assessment and treatment using pharmacological and non-pharmacological means for pain control should start in the preoperative phase and continue throughout the rehabilitation and prosthetic training.*

- 12. When assessing pain, standardized tools should be used. E.g.; Visual Analogue Scale (VAS), Short Form McGill Pain Questionnaire (SF-MPQ), and Pain Interference Scale (PIS).

- 17. Transition to a non-narcotic pharmacological regimen combined with physical, psychological, and mechanical modalities should be considered throughout the rehabilitation process.

- 18. There is no consistent evidence to support or refute one specific type of pain control.
Medical Care

Comprehensive medical assessment and the management of individuals undergoing amputation are imperative throughout the continuum of care. Optimizing medical, surgical, and rehabilitation outcomes requires a holistic approach to patient care.
Cognitive Assessment

A cognitive/neuropsychological assessment should be conducted prior to the operation, if possible, to assist in the process of determining the patient’s ability to learn, adapt to, and utilize a prosthesis following surgery as well as the long-term abilities for autonomous and independent living. The assessment may be repeated after the surgery if indicated by the patient’s function or the response to treatment.
The Residual Limb

The residual limb should be appropriately managed to prepare for prosthetic training and to enhance functional outcomes.

27. Limb volume management
28. .....educated about care and management of the residual limb
29. Interventions to prevent contracture....
31. Limb protection should be emphasized ...
32. Skin and soft tissue should be monitored ...
The Contralateral Limb

Comprehensive evaluation of the neurological, musculoskeletal, soft tissue and vascular status of the contralateral limb is necessary to initiate educational programs and establish specialized footwear or orthotic needs.

34. Comprehensive assessment …
35. …educated about strategies to protect …
36. Appropriate foot care as indicated …
Core recommendations
CORE-8.

- Behavioral Health Assessment and Treatment
  - Complete a psychological assessment in the preoperative phase, if possible. Evaluate the psychosocial status and treat problems throughout all phases of rehabilitation.
  - 43. Specific structured interventions for problems such as depression, anxiety, sexual difficulties, substance abuse or drug overuse, and pain should be considered.
  - 46. The use of validated tools for assessment should be considered: e.g. Prosthesis Evaluation Questionnaire (PEQ), Trinity Amputation and Prosthetic Experience Scales (TAPES), The Hospital Anxiety and Depression Scale (HAD), The SF-36 Health Survey
Social Environment (Support)

- Identify the social and physical support system that will be available to the patient during the rehabilitation process and help cope with the challenges of limb loss.

- Interpersonal Social Environment
- Physical Environment
- Economic Environment
Core recommendations
CORE-10.

- Peer Support Interventions

Peer support should be considered, if available, throughout the course of amputation and rehabilitation.
Patient Education

Patients scheduled for amputation should receive in-depth education regarding the procedure itself, and the various components of postoperative care and rehabilitation activities that will occur. A combination of information-giving and coping skills training should continue through all phases of the rehabilitation care.
### Table 7. Patient Education Summary Table

| Education Content               | Learning assessment | Pain control | Patient safety/falls | Complication prevention | Incentive spirometry | Tobacco cessation | Bowel/bladder management | Deep vein thrombosis prevention | Contracture prevention | Pressure ulcer reduction | Edema control | Sequence of amputation care | Prosthetic options | Wound care/scar management | Role of interdisciplinary team members | Peer support | Protection of contralateral limb | Signs/symptoms of infection | Care of prosthesis | Donning/doffing prosthesis | Skin hygiene |
|---------------------------------|---------------------|--------------|----------------------|-------------------------|------------------------|--------------------|------------------------|---------------------------|--------------------------|------------------------|----------------|----------------------------|---------------------|-----------------------------|--------------------------------|---------------|-------------------------------|---------------------|------------------------|------------------------|
| Preoperative                    | x                   | x            | x                    | x                       | x                      | x                  | x                      | x                         | x                        | x                      | x             | x                          | x                   | x                          | x                                           | x             | x                             | x                   | x                      | x                      |
| Postoperative                   | x                   | x            | x                    | x                       | x                      | x                  | x                      | x                         | x                        | x                      | x             | x                          | x                   | x                          | x                                           | x             | x                             | x                   | x                      | x                      |
| Pre-prosthetic rehabilitation   | x                   | x            | x                    | x                       | x                      | x                  | x                      | x                         | x                        | x                      | x             | x                          | x                   | x                          | x                                           | x             | x                             | x                   | x                      | x                      |
| Prosthetic training            | x                   | x            | x                    |                          | x                      | x                  | x                      | x                         | x                        | x                      | x             | x                          | x                   | x                          | x                                           | x             | x                             | x                   | x                      | x                      |
Core recommendations
CORE-12.

- Learning Assessment
- Obtain a learning assessment of the patient and family.
Physical Rehabilitation

The aim ... is to achieve maximum independence and function.

takes into account their pre-amputation lifestyle, expectations, and medical limitations.

The level of amputation, physical and psychological presentation, and social environment influence the expected level of functional independence.

identify when the individual has achieved optimum function with or without the prosthesis
Core recommendations
CORE-13.

- Physical Rehabilitation
- CORE-13.1 Range of Motion
- CORE-13.2 Strengthening
- CORE-13.3 Cardiovascular Fitness and Endurance
- CORE-13.4 Balance
Functional Rehabilitation

Functional rehabilitation includes assessment and activities, such as activities of daily living (ADL), transfers, and mobility, which are performed to achieve a functional goal.

14.1 Functional Activities of Daily Living
14.2 Mobility (table 8) and Equipment
14.3 Community Reintegration
# Table 8. Advantages and Disadvantages of Recommended Mobility Assessment Tools

<table>
<thead>
<tr>
<th>Tool</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
</table>
| Amputee Mobility Predictor (AMP) | • Valid both with and without a prosthesis  
• High inter- and intra-rater reliability  
• Correlates with the 6-Minute Walk as a predictor of prosthetic success  
• Negative correlation with age and comorbidity  
• Can be performed in 15 minutes or less in the clinic  
• Requires little equipment | • None found in the literature review |
| Functional Independence Measure (FIM) | • Easily performed during evaluation and at intervals during rehabilitation  
• Good intra- and inter-rater reliability  
• Good predictor of continued prosthetic use after discharge | • Does not act as a predictor of prosthetic success  
• Does not fully capture functional changes with progression of therapy  
• Highest functional level that can be attained with a prosthesis is 6 out of 7 regardless of the patient’s functional abilities (ceiling effect) |
| Two-Minute Walk               | • Easily performed in the clinic  
• High intra- and inter-rater reliability  
• Responsive to change with continued rehabilitation  
• Correlates with other measures of physical function (6-Minute Walk, 12-Minute Walk) | • Increases in distance may simply be related to external cues rather than a response to therapy |
| Timed Up and Go (TUG)         | • Easily performed in the clinic  
• High intra- and inter-rater reliability | • No studies found regarding predictive validity  
• No studies found regard TUG in gait with a single limb and assistive device  
• One study indicates that the TUG is dependent on the chair type (arms and height) |
| Upper Extremity Ergometry     | • Has been shown to be an effective way to determine safe maximal heart rates for exercise and prognostic information concerning the functional outcome after rehabilitation  
• Patients that achieve a maximum work capacity of 45 watts per minute were able to ambulate with a prosthesis without an assistive device; those that achieve a maximum work capacity of 60 watts per minute were able to ambulate outdoors with their prosthesis  
• Easy to administer and inexpensive | • Severe cardiac disease is prevalent in patients with dysvascular amputations  
• Patients should be monitored for arrhythmias and ST-segment depression throughout testing or exercise programs |
Module A

- Preoperative Assessment and Management
Module A  Preoperative Assessment and Management

1. Clinical Decision to perform amputation [A1]

2. Is this an urgent need for amputation (trauma or infection)? [A2]
   - Y
   - N

6. Preoperative assessment:
   - Medical status
   - Contralateral limb
   - Functional status
   - Pain control
   - Behavioral health status
   - Cognitive status
   - Patient goals and priorities
   - Social environment
   [A2]

7. Develop treatment plan [A4]
   - Optimize medical status prior to surgery [A5]
     - See Sidebar A
   - Initiate appropriate rehabilitation [A6]
   - Initiate discharge planning [A7]

8. Perform learning assessment
   - Provide patient education about:
     - Treatment procedures and anticipated experiences
     - Prevention of complications
     - Fall prevention and safety
   [A8]

9. Is patient status optimized for surgery?
   - Y
   - N

10. Optimize patient status [A5]

3. Arrive at shared decision and complete informed consent process [A9]

4. Determine operative approaches and procedures:
   - Appropriate level of surgery
   - Postoperative dressing (see Sidebar B) [A10]

5. Perform amputation reconstructive surgery:
   - Adhere to surgical principles
   - Utilize effective postoperative dressing [A11]

Continue on Module B Immediate Postoperative Rehabilitation

Sidebar A: Optimizing Medical Comorbidity
1. Cardiovascular (including DVT prophylaxis)
2. Pulmonary
3. Metabolic
4. Nutrition
5. Psychiatric Illness

Sidebar B: Postoperative Dressing
- Custom rigid dressing
- RRD - Rigid removable dressing
- IPOP - Immediate postoperative prosthesis
- NWB - Non-weight bearing rigid dressing
- Prefabricated dressing
- Soft dressing
An appropriate postoperative dressing should be selected by the surgeon in the preoperative phase to protect the residual limb, decrease edema, and facilitate wound healing; consider the use of a rigid postoperative dressing.
Table 9. Categories of Wound Healing (adapted from Smith, 2004)

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category I:</td>
<td>Primary; heal without open areas, infections or wound complications; no wound healing intervention required.</td>
</tr>
<tr>
<td>Category II:</td>
<td>Secondary; small open areas that can be managed and ultimately healed with dressing strategies and wound care. Additional surgery is not required. May be possible to stay with the original plan with some portion of the wound intentionally left open.</td>
</tr>
<tr>
<td>Category III:</td>
<td>Skin and subcutaneous tissue involvement (no muscle or bone involvement); requires minor surgical revision.</td>
</tr>
<tr>
<td>Category IV:</td>
<td>Muscle or bone involvement; requires major surgical revision but heals at the initial amputation “level.”</td>
</tr>
<tr>
<td>Category V:</td>
<td>Requires revision to a higher amputation level; for example, a transtibial amputation that must be revised to either a knee disarticulation or a transfemoral amputation.</td>
</tr>
</tbody>
</table>
Patient discharged from acute care after amputation surgery [C1]

Postoperative assessment:
- Medical Status
- Physical & Functional status
- Pain control
- Behavioral health status
- Cognitive status
- Social environment
- Residual limb and wound healing [C2]

Determine rehabilitation goals [C3]

Provide treatment as needed to optimize patient’s medical condition(s) for rehabilitation [C4]

Provide Patient Education [C5]

Establish/update rehabilitation treatment plan [C6]

Provide physical and functional intervention based on current and potential function (See Sidebar H) [C7]

Is prosthesis appropriate to improve functional status and meet realistic patient goals? [C8]

Y

Prescribe appropriate DME [C9]

Have rehabilitation goals been met? [C10]

Y

Reassess goals and reevaluate treatment plan

N

Follow-up

See Module E

Module D  Prosthetic Training

Continue from Module C

Determine functional goals of prosthetic fitting (see Sidebar I) [D1]

Is there current or potential ability to transfer or ambulate?

Y

N

Prescribe prosthesis to improve quality of life [D3]

Prescribe prosthesis based on current or potential level of ambulation [D2]

Perform basic prosthetic fitting and early rehabilitation management [D3]

Is patient ambulatory?

Y

N

Provide education on functional use of prosthesis [D5]

Provide education on functional use of prosthesis for transfers, balance, safety [D5]

Monitor and reassess functional and safe use of prosthesis. Optimize components and training [D5]

Prescribe appropriate DME and training [D7]

Have rehabilitation goals been met?

Y

N

Reassess goals and reevaluate treatment plan

Follow-up

See Module E

Sidebar I: Current or Potential Ambulation Classification

- No potential to ambulate (K-0)
- Standing, transerring or household ambulation (K-1)
- Limited community ambulation (K-3)
- Perform athletic activities (K-4)
<table>
<thead>

Patient following limb-loss with/without prosthesis [E1]

Schedule at least one follow-up appointment within the first year after discharge from rehabilitation and prosthetic training [E2]

Provide follow-up assessment and treatment (See Sidebar J) [E3]

Provide secondary amputation prevention:
- Assessment of risk factors
- Foot preservation care
- Encourage cardiovascular fitness
- Patient education for lifestyle modification (increase exercise, improve nutrition and encourage smoking cessation)
- Diabetes control (See Diabetes Guideline) [E4]

Continue intermittent/regular follow-up:
- after major medical change
- after major functional change
- referral/consultation received
- at patient’s request

Provide follow-up assessment and treatment as needed (See Sidebar J) [E5]

Sidebar J: Follow-Up Assessment

1. Patient’s goals
2. Functional Assessment
   - Gait and mobility
   - Residual limb
   - Contralateral limb
   - Socket fit or residual limb volume
   - Strength/ROM
   - Changing needs for DME
   - Activities of daily living
3. Secondary complications
   - Pain control
   - Skin integrity
   - Associated musculoskeletal conditions
4. Prosthetic assessment (repair, replacement, mechanical adjustment, new technology)
5. Vocational and recreational needs

SUMMARY OF RECOMMENDATIONS

CARE AND TREATMENT PATHWAYS

Following review of current practice in NSW amputee services, we recommend that:

1. the Guidelines for the Accreditation for Amputee Clinics be extended to require the clinic to demonstrate an operational protocol for the effective integration of surgical and rehabilitation services.

2. the craft groups of the Royal Australasian College of Surgeons relevant to amputation – vascular, orthopaedic and plastic surgery – be approached by the Department for support in the development of such protocols.

3. the use of rigid dressings (fixed or removable) in the management of the residual lower limb be encouraged as standard practice in NSW (adult) amputee services.

4. the provision of mechanical interim prostheses (manufactured by a prosthetist) be implemented as standard practice in NSW amputee services.

5. staff prosthettist positions be established in NSW amputee services. (This recommendation is made in the context of the consolidated service structure recommended below).

6. NSW amputee services and the ALS adopt a more systematic approach to quality management, particularly in respect of benchmarking amputee services and surveying patient experience of care and adapting practice in light of the information obtained.

7. a review of current ALS guidelines for the supply of prosthetic components be undertaken by the Components Committee of the ALS, with the objective of developing prioritised funding proposals to enable greater flexibility in prescribing prosthetic componentry suited to individual client needs.

Review of the NSW Artificial Limb Service 2004
THE NSW ALS SERVICE MODEL

Following review of the current model for the delivery of amputee services in NSW, we recommend that:

8. amputee and artificial limb services (ALS) in NSW should be provided within the framework of a limited number of comprehensive ‘amputee services’. This report is not prescriptive with regard to the number of such services, but at a maximum there should be one service per Area Health Service. The number of services should be determined by the Department of Health after further consultation with Area Health Services and involved clinicians.

9. each service should include or have access to the following clinical staff:
   1. Rehabilitation Physicians
   2. Physiotherapists
   3. Prosthetists
   4. Nurses
   5. Occupational Therapists
   6. Psychologists
   7. Affiliated surgeons
   8. A range of other providers – Podiatrists, Social Workers, Dieticians.

10. amputations should be carried out by senior surgeons experienced in amputation surgery, at a hospital designated by the particular service for this purpose.

11. discussions should be held with the Royal Australasian College of Surgeons and relevant craft groups to obtain their support for this service model.

12. each service should have a Clinical Director who is an appropriately qualified, experienced clinician. This will commonly be a rehabilitation physician.

13. before any planned amputation, the Clinical Director or a suitably experienced Rehabilitation Physician nominated by him/her should be consulted, ideally together with a prosthettist and physiotherapist who will be involved in rehabilitation after the surgery.

14. each service should hold outpatient amputee clinics at a number of different centres as required to enhance access for people with amputations.
Outcome Confounders

- Post-op pain
- Physical Health
- Function (dc FIM)
- Psych Well-being
- Pt Satisfaction
- Reintegration (dc Dest)
- Healthcare Utilisation (LOS, FIM effic)

- Pain service availability
- Lack of AHP in acute
- Deconditioning +++, post-op
  Cxs: contractures, PAs, Cognition
- Social isolation, Psych services
- Adjustment, PreM Hx
- Alone, unsuitable accomm, home mods
- Wound healing, Comorbids: DM, IHD, CCF...
Problem areas

- Consequences of prolonged immobility
- Medical co-morbidity
- Delayed wound healing
- Cognitive impairment
- Adjustment issues
- Learning capacity
- Inappropriate accommodation
- Intransigent attitudes
